LA-110 is an advanced Integrated Access Device (IAD) offering voice, data, and LAN service extension over ATM or packet-switched networks.

The services supported by LA-110 include:
- High-quality leased lines over E1 or serial data links
- E1 (CES, PRI, UNI)
- Cellular backhaul
- High-speed data (transparent and Frame Relay)
- Ethernet with MAC bridge and IP router
- Voice, such as ISDN BRI, PRI or FXS.

MULTISERVICE OVER ATM

The UNI network interface supports the following ATM adaptation layers:
- AAL1 – Transparent transport of serial data streams, and circuit emulation services (CES)
- AAL2 – ATM Forum Loop Emulation Services (LES) for PSTN and ISDN BRI and PRI access
- AAL5 – Packet traffic (Frame Relay, Ethernet, IP).
LA-110
Advanced Integrated Access Device

The network interface supports the following classes of service: CBR, VBR, UBR, and UBR+.

Per connection user-configurable traffic shaping and traffic contract enforcing ensure improved QoS and efficient utilization of the ATM uplink bandwidth.

MULTISERVICE OVER PSN
LA-110 provides legacy services over packet networks. The device converts the data stream from its user E1/T1 or data ports into packets for transmission over the network. The frame format of these packets is IP or MPLS. These packets are transmitted via the LA-110 network port to the PSN. A remote pseudowire device converts the packets back to the original user traffic format.

The unit supports various legacy over packet transport types, including TDMoIP, CESoPSN, SAToP, HDLCoPSN, and FRoPSN.

Proper balance between PSN throughput and delay is achieved via configurable packet size.

A jitter buffer compensates for packet delay variation (jitter) of up to 40 msec in the network.

PW QoS/CoS
The Quality of Service/Class of Service varies according to network type:

- Ethernet networks – Outgoing pseudowire packets are assigned a dedicated VLAN ID according to 802.1Q and marked for priority using 802.1p bits.
- IP networks – Outgoing pseudowire packets are marked for priority using DSCP, ToS, or Diffserv bits.
- MPLS networks – Outgoing pseudowire packets are assigned to a specific MPLS tunnel and marked for priority using EXP bits.

PW FAULT PROPAGATION
The fault propagation mechanism initiates user port alarms, such as E1/T1 LOS, to reflect packet network fault conditions. Alarms detected at user ports are propagated to the remote pseudowire device via the packet network.

PW PERFORMANCE MONITORING
Performance monitoring is provided by Ethernet and IP-layer network condition statistics, such as packet sequence errors (loss or misorder) and packet delay variation (jitter), which are monitored and stored by the device.

NETWORK INTERFACE
LA-110 has one network port that can be ordered with one of the following interfaces:

- Single 2- or 4-wire SHDSL interface
- IMA over 4 ×2-wire SHDSL for a combined data rate of up to 9.2 Mbps and extended range
- E1 interface.

ETHERNET INTERFACE
The Ethernet 10/100BaseT port supports autonegotiation and flow control.

The Ethernet interface can be configured to operate as a MAC bridge or an IP router.

In bridge mode, the Ethernet interface operates as a self-learning media access bridge. The MAC bridge can be configured to VLAN-aware or VLAN-unaware mode.

In bridge mode, the Ethernet traffic can be classified according to 802.1p, IP precedence, ToS, or DSCP. The traffic classes are mapped using the ATM CoS or WFQ mechanism. LA-110 supports up to eight QoS rules.

Figure 1. Providing Leased Line Services over ATM or Packet-Switched Network
When configured to operate as an IP router, LA-110 supports:

- 1–2 IP networks (sharing the same physical Ethernet interface)
- 1–8 WAN ports, each using its own PVC
- An optional host interface for router management.

The router uses static routing entries or RIP I/II for routing decisions. It can also use policy-based routing (PBR) to define user-specific routing rules, overriding the routing table settings.

In IP router mode, LA-110 performs encapsulation per RFC2684, or transfers the traffic using PPPoA (with PAP and CHAP authentication).

The device serves as a DNS relay, exchanging DNS requests and replies between its hosts and the DNS server.

A firewall can be set on each router interface (WAN, LAN) for filtering inbound or outbound traffic.

LA-110 can be configured as a DHCP server or to DHCP relay mode.

When operating opposite a RADIUS server, the unit performs client authentication.

The IP router provides up to 20 NAT/NAPT translations. Each translation can be applied to a WAN or LAN port.

**DATA INTERFACE**

The LA-110 data port is a synchronous serial DCE port, supporting V.35 and X.21 interfaces. The data port operates at rates \( n \times 64 \text{ kbps} \) in the range of 64 to 2048 kbps.

The data payload is processed in accordance with the user-selectable application mode: AAL1 or Frame Relay. In AAL1 mode, the data stream is transferred transparently in the CBR service category. The AAL1 stream mode supports any Layer-2 protocol.

When the LA-110 data port operates in Frame Relay mode, the traffic is carried over AAL5, in the user-configurable ATM service category.

The device supports up to 8 DLCIs. The Frame Relay interworking mode can be configured to:

- Service interworking per FRF.8
- Network interworking per FRF.5.

**FXS INTERFACE**

LA-110 can be ordered with four independent FXS analog voice interfaces, for direct connection to subscriber POTS phone, fax, or voiceband modem equipment. Each port provides power feed and ringing to the subscriber equipment.

The input and output audio levels of each channel are user selectable. The signals are encoded by a PCM codec, using 64-kbps PCM encoding per ITU-T Rec. G.711, enabling transparent transfer of DTMF signaling, Group III fax signals, and voiceband modem signals.

Each channel includes a near-end echo canceller. The echo canceller can be disabled when processing fax or modem signals.

For compatibility with national implementations, the PSTN signaling characteristics are user selectable.

The transport of analog voice requires LES over AAL2, which allows several voice connections to share the same VC. The ELCP can also be used.

**ISDN INTERFACE**

Four independent ISDN BRI S0 interfaces comply with ETSI 300012 and ITU-T Rec. I.430. The interface characteristics are compatible with many types of ISDN switches, including NTT, SUES, DMS-100, and NI1.

The ISDN interface operates in NT (Network Termination) mode, enabling direct connection of ISDN terminal equipment to “S” ports.

The ISDN ports require use of LES over AAL2, allowing several connections to share the same VC. The ELCP can also be used. The signaling information carried by the multiplexed 64-kbps D channel is transported transparently to the voice gateway.

**E1 AND T1 USER INTERFACE**

LA-110 can be ordered with one user E1 or T1 port with balanced or unbalanced (E1) interfaces.

The E1 interface supports the following framing modes:

- G732S
- G732N
- Unframed
- ISDN PRI (AAL2 only)
- E1 ATM UNI.

---

![Figure 2. Providing VoDSL Using LES over AAL2](image-url)
LA-110
Advanced Integrated Access Device

In AAL1 mode, LA-110 uses the following transmission methods:
- Structured CES, transmitting each E1 bundle over a separate PVC
- Dynamic bandwidth allocation (DB-CES) for detecting voice channel activity and allocating uplink bandwidth accordingly.

In AAL2 mode, LES is used for voice support, with or without ELCP. Application identifiers determine the signaling methods:
- CAS
- PSTN signaling
- DSS1 for ISDN BRI and PRI
- ISDN PRI remote access with ELCP.

LA-110 transparently transfers the ATM-based E1 UNI services at the rate 1984 kbps.

The balanced T1 user interface offers the same transmission and signaling methods as the E1 user interface.

TIMING MODES
The device supports flexible timing modes for hierarchical timing distribution in the network.

The LA-110 system timing can be locked to the following sources:
- NTR – Timing reference is locked to the DSLAM clock
- Received – Clock is received from the E1 equipment
- Adaptive – Clock is locked to an average arrival rate of the ATM cells carrying voice channels
- Internal – Clock is generated by the internal oscillator.

MANAGEMENT
The unit can be managed using the following ports and applications:
- Local out-of-band management via an ASCII terminal connected to the RS-232 port
- Remote out-of-band management via the LAN port
- Remote inband management via the ATM uplink. Remote management is performed using Telnet, Web browser, or RADview, RAD’s SNMP-based management access system.

Different stations can manage LA-110 simultaneously, enabling monitoring the network status from different locations.

PLUG & PLAY
LA-110 supports automatic configuration from a remote location. Once the unit is installed, it needs only to be powered up. It then automatically receives its management IP address, and all the configuration procedures can be performed from the remote location.

DIAGNOSTICS
LA-110 collects performance monitoring statistics at the physical and ATM layers for the network and user interfaces. It also provides statistics for individual connections (AAL1, AAL5).

Comprehensive diagnostic capabilities include:
- Physical loopbacks on the network and user interfaces
- OAM loopback on a VCC
- Ping for IP connectivity checks.

LA-110 stores alarms detected during operation in a buffer holding up to 200 alarms.
